

Consumer Incomes Up in All Regions in 1960

PERSONAL income was at a record dollar total in each of the 50 States last year as the Nation's economy first moved ahead under the impetus of expanded demand and then turned down briefly.

For the country as a whole, individual incomes in 1960 totaled \$400 billion—\$19 billion, or 5 percent, more than in 1959. Despite a 1½ percent increase in consumer prices, real incomes were up throughout the country.

Uniformity in State rates of change from 1959 was a feature of last year's income flow. More than half of the States (28) came within 1 percentage point of the national pace. By regions, uniformity was even more pronounced.

There were five States in which the 1960 relative gain exceeded the national average by substantial margins. The largest occurred in South Dakota where farm income more than doubled, pushing the aggregate income up by one-fourth.

Next largest rates of gain from 1959 to 1960 were in Alaska and North Dakota (18 percent each), Hawaii (12 percent), and Arizona (11 percent). In North Dakota, the rise centered mainly in agriculture. In the other three States, the above-average increases reflected pervasive gains throughout most of their economies.

Although business declined in the latter part of 1960, the reduction was moderate. Individual incomes in every month of last year were higher than in the corresponding month of 1959, and total income on a seasonally-adjusted basis rose through October. The downturn that followed was comparatively mild and short-lived, and by March of 1961 personal income had recovered all of the ground lost since the prerecession October peak.

For the country as a whole, per capita personal income (total income divided by total population) amounted to \$2,223 in 1960—up \$63, or 3 percent,

from 1959. Price increases nearly counterbalanced this rise, however, and real per capita income in 1960 was only a little more than in 1959.

Average incomes in 1960 were highest in Delaware (\$2,013), the District of Columbia (\$3,008), Connecticut (\$2,863), Nevada (\$2,844), New York (\$2,789), Alaska (\$2,735), California (\$2,741), New Jersey (\$2,665), Illinois (\$2,613), and Massachusetts (\$2,519). The fact that all of these States except Alaska are located in New England, the Mideast, Great Lakes, and Far West is indicative of the concentration of high incomes in the north and west.

This article continues the series of reports on State changes in personal income published annually in the *Survey*. The estimates for 1960 presented here are revisions of the preliminary figures published in the April 1961 issue of the *Survey*. Those for 1958 and 1959 also are revisions of earlier estimates. For convenience, total in-

Major Differences Came From Developments in Agriculture and Manufacturing

Percent Change 1959-60

come for the years 1954-57 and per capita income for 1950-57 are reprinted in table 1 along with the 1958-60 data. Total and per capita income figures for earlier years may be found in the Personal Income supplement to the SURVEY.¹

Industrial Developments

Nationally, income in all major industries advanced from 1959 to 1960. As indicated in the chart, State differences in rates of total income change last year stemmed mainly from developments in farming and manufacturing, although variations in other industries also had an impact.

Farm income volatile

On a national basis, farm income totaled 4 percent more in 1960 than in 1959—a somewhat smaller increase than the average of all nonfarm components. By States and regions, income from agriculture showed the widest variations in rates of change. These ranged from drops of one-tenth in several major agricultural States to a more than doubling in South Dakota—the latter in part a recovery from the previous year's decline in wheat production. There were reductions in 18 States and increases in 30; in 7, the decline was 10 percent or more; in 14, the gains exceeded 15 percent.

The influence of farming on changes in total income in 1960 shows most clearly in the Plains region. Five of the seven States in this area experienced exceptionally large gains in farm income last year, and 3 of these—South Dakota, North Dakota, and Nebraska—were among the top half-dozen States in the Nation in terms of relative increase in total income. On the other hand, declines in income from agriculture were primary factors in the limited gains in aggregate income in Iowa and Missouri.

Except in the last two States, there

were gains in most types of farming in the Plains, but the bulk of the net income rise came from a step-up of more than one-third in the value of wheat production. In all States of the region, gross income from meat animals declined, while in Iowa and Missouri lower wheat production pushed the total value of crops in 1960 below that in 1959.

Elsewhere agricultural developments with discernible effect on the total income flow included an increase in income from tobacco farming in North Carolina; a spurt of two-thirds in cash

receipts from potatoes in Maine; increased production of crops generally in Oklahoma; sharp increases in wheat production in Oklahoma, Texas, Ohio, and Indiana; a decline in the value of cotton production in the States of the "old" cotton belt; and reductions in income from cattle and calves in most States as 1960 prices fell short of those in 1959.

Manufacturing a limiting factor

For the country as a whole, earnings of persons engaged in manufacturing increased 3 percent from 1959 to 1960, half the rate of increase in nonmanu-

¹ Computed from tables 1 and 2.

1. "Personal Income by States Since 1920" is available from the Superintendent of Documents, U.S. Government Printing Office, Washington 25, D.C., or from the Department's Field Offices at \$1.50 per copy. The text of the report provides complete explanations of the concept, statistical derivation, and reliability of the estimates, as well as an analysis of geographic income shifts over the period. The Personal Income supplement also contains detailed breakdowns of income in each State according to type and industrial source for the years 1920-53. Details for 1954-60 may be found in the August 1959 SURVEY; for 1957 in the August 1960 SURVEY; and for 1958-60 in tables 4-7 of this issue.

facturing income. The national increase reflected recovery from the 1957-58 recession; the upswing following the 1959 steel strike and its secondary effects; and the 1960 business decline which centered in a slide in durable goods production. Because of State differentials in manufacturing, the impact of these developments varied throughout the country.

In New England, the Mideast, and the Great Lakes the relative smallness of the gain in manufacturing income retarded significantly the overall income

rise. Because of the lesser importance of factory production in the economy of the Plains, Southwest, and Far West, the comparatively small increase in manufacturing activity in each of these regions had limited effect on total income. By contrast, a rise of one-tenth in factory earnings in the Rocky Mountain States—centering in Colorado and Utah and noted below—reinforced the upswing in nonmanufacturing income there even though these are the least industrialized States in the country. In the Southeast, income from man-

ufacturing increased at the same rate as that in other industries, generally.

Approximately one-half of the Nation's income from manufacturing is derived from six major industries, and many of the 1959-60 State changes can be explained largely by changes in the wages and salaries paid out by these groups.

Payrolls increased 3 percent on a national basis in those industries producing primary and fabricated metals and nonelectrical machinery. They declined 4 percent in aircraft production.

¹ To maintain comparability, both the numerator and denominator include Alaska and Hawaii.

These changes were primarily responsible for the smallness of the rise in total manufacturing in the Great Lakes, Plains, and Southwest. In contrast, there were gains of 6 and 8 percent, respectively, in payrolls of auto and electrical machinery producers. The spurt in auto production was concentrated in Michigan and was the main factor in that State's comparatively favorable manufacturing experience last year—the best in the Great Lakes region, and one of the best among major industrial States.

The 8-percent advance in payrolls of manufacturers of electrical machinery focused on California where a rise of more than \$200 million in 1960 approximately matched the payroll declines in that State's large aircraft industry.

Expansion of electrical machinery production in Massachusetts and of nonelectrical machinery in Connecticut did much to boost overall factory payrolls in New England, although, on balance, these gains did not offset the sluggishness of the payroll rise elsewhere in New England's factory economy.

In a number of States the course of manufacturing last year was dominated by developments in a single industry. In Rhode Island, a decline in textiles; in Kansas, slackened aircraft production; in Montana, and Idaho, decreased payrolls in lumbering; in Colorado, a speedup in the aircraft industry; and in Delaware, a spurt in chemical production. In contrast, the sizable factory payroll gains in Utah (17 percent) and Arizona (9 percent) were broadly based with payrolls advancing in seven of the eight major manufacturing industries in these two States.

Government income disbursements

Government income disbursements gave buoyancy to the income flow in 1960. The total paid directly to individuals by Federal, State, and local governments increased \$5 billion, or 7 percent, from 1959 to 1960, the largest advance in any major component. There was uniformity in rates of change among regions, with only the Far West scoring a gain appreciably different from the national figure. There, government added \$1 billion to the area's

income flow and accounted directly for one-third of that region's top-ranking income rise.

Largest increases in government income payments from 1959 to 1960—all approximately one-tenth—were scored in California, Ohio, Oregon, Mississippi, and North Dakota. In each, wages and salaries paid government employees was a primary factor. In California and Ohio, the advance was concentrated in State and local agencies. In Mississippi and Oregon, both Federal civilian and State and local payrolls increased; while in North Dakota, a sharp rise in military pay provided the major impetus.

Conversely, in Rhode Island, Arkansas, Virginia, West Virginia, Vermont, Tennessee, and the District of Columbia, declines in military payrolls, together with only limited gains in Federal civilian pay—in part a reflection of the curtailment in military activities—held the advances in total government income disbursements to below-average proportions.

Factors other than payrolls introduced some irregularities into the flow of government income disbursements last year. In Pennsylvania and Illinois, payments of bonuses to veterans expanded sharply. In Iowa, Minnesota, and Montana, completion of veterans' bonus payments in 1959, or their sharp reduction in 1960, had a dampening impact on government income.

In a half-dozen States changes in unemployment benefits had substantial influence on the flow of total income. In California and Ohio, UI disbursements were up \$150 million and \$65 million, respectively. In addition to legislative actions relating to the duration and rates of benefits, unemployment rose sharply in both States as aircraft production in California and auto and auto-parts manufacturing in Ohio were curtailed.

Sizable reductions in UI disbursements in New York, New Jersey, Pennsylvania, Delaware, West Virginia, and Illinois reflected both the exhaustion of benefit rights by many persons, as well as a lower volume of payments in these industrial States as the Temporary Unemployment Compensation Act of 1958 terminated in early 1959.

Changes in other industries

Nationally, earnings of persons engaged in mining in 1960 were little changed over the previous year; this, however, represented an "averaging-out" of significant changes in several of the major mining States. There were declines in coal and petroleum-producing States and significant gains in those with a concentration of mining and quarrying other than fuel. Minnesota scored a top-ranking gain of nearly one-third in income from mining as iron ore shipments almost doubled the strike-affected levels of 1959.

In most regions the increase in construction earnings paralleled the national advance of 3 percent. By States, however, disbursements in this industry exhibited wide variations ranging from a decline of nearly one-tenth in North Dakota to an increase of almost one-third in Wyoming.

An increase in roadbuilding projects was a primary factor in the expansion of construction income in South Dakota, Nebraska, Arkansas, and Nevada. In Alaska, outlays for highway construction more than doubled, providing a partial offset to declines in nonhighway construction due to completion of defense projects. Conversely, termination of roadbuilding projects in the latter part of 1959 and 1960 appreciably retarded the flow of income from construction in Pennsylvania, North Dakota, Kentucky, and Kansas.

Income of persons engaged in the numerous trade and service establishments registered a top-ranking gain of 6 percent. The rise was broadly based and although most States conformed closely to the uniform regional pattern, noteworthy gains ranging from one-tenth to one-fifth were scored by the tourist-oriented areas of Nevada, Arizona, Florida, Hawaii, and the District of Columbia.

The economy in early 1961

Last year's business decline did not manifest itself in the personal income flow until late in 1960, and hence, its geographic impact is blurred in the comparisons involving calendar years 1960 and 1959 which have formed the bulk of this report.

Because recent period changes in the

production cycle centered in the manufacturing industry, a gauge of their geographic effects may be had through comparison of monthly changes in factory payrolls which can be estimated from employment and earnings data compiled by the Bureau of Labor Statistics. In the first quarter of 1961, payrolls in manufacturing were \$5 billion (at annual rates) less than in the corresponding quarter of the previous year. Declines were confined generally

to the central and eastern areas of the Nation, with the largest reductions in the most industrialized States. In contrast, the western regions registered moderate improvements in factory payrolls over the year.

By May of 1961, the economy had passed the prerecession peak, and manufacturing wages and salaries had recovered most of the fall and winter reductions. Recovery lagged most

where the declines had been greatest—the Great Lakes and Mideast. Similarly, the Western States continued to forge ahead in factory production. It is significant that wages and salaries in the Great Lakes, Mideast, and New England States are currently at about the same level as 4 years ago—just prior to the 1957 recession; those in the less industrialized regions of the south and west are one-fifth higher.

Footnotes to Table 63:

1. Consists of net income of farm proprietors, farm wages, and farm "other" labor income, less personal contributions under the OASI program.

2. Consists of income disbursed directly to persons by the Federal and State and local governments. Comprises wages and salaries (net of employee contributions for social insurance), other labor income, interest and transfer payments.

3. Equals total personal income less farm income and government income disbursements.

Note: United States totals include Alaska and Hawaii.

Footnotes to Table 70:

1. Consists of wage and salary disbursements, other labor income, and proprietors' income.

2. Does not include earnings of military personnel.

3. Less than \$500,000.

Note: United States totals include Alaska and Hawaii.
